

Model Building

Configure the Learning Process

Date	17 November 2022
Team ID	PNT2022TMID34036
Project Name	AI-Powered Nutrition Analyzer for Fitness Enthusiasts

Configure The Learning Process

- The compilation is the final step in creating a model. Once the compilation is done, we can move on to the training phase.
- The loss function is used to find errors or deviations in the learning process. Keras requires a loss function during the model compilation process.
- Optimization is an important process that optimizes the input weights by comparing the prediction and the loss function. Here we are using adam optimizer.
- Metrics are used to evaluate the performance of your model. It is similar to the loss function, but not used in the training process.

Compiling the model

```
[ ] # Compiling the CNN
    # categorical_crossentropy for more than 2
    classifier.compile(optimizer='adam', loss='sparse_categorical_crossentropy', metrics=['accuracy'])
```
